Advanced CSS Selectors

Basic CSS Selectors

- Type selectors: `li {color:red}`
- Class selectors: `li.spacious {margin: 20px}`
- ID selectors: `#bordered {border:1px black solid}`
- Universal selectors: `* {color :green}`
- Attribute selectors:
 - `a[href="https://www.google.com"] {font-size: 2em}`
 - more on [syntax](#)
- Combine selectors into a selector list, using `,`

```
h1, .special {  
  color: blue;  
}
```

Adjacent sibling combinator

- Siblings

- Syntax: +

```
/* Paragraphs that come immediately after any h1 */
h1 + p {
  color: red;
}
```

General sibling combinator

- Siblings

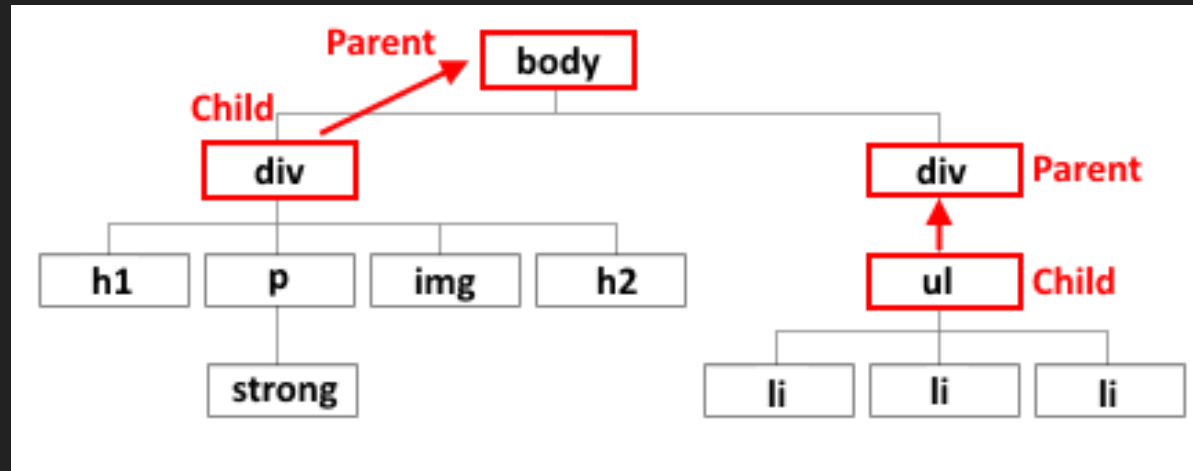

- Syntax: ~

```
/* all <h2> elements that are siblings of and subsequent to any h1 */
h1 ~ h2 {
  color: red;
}
```

Child combinator

- Parent and child

- Syntax: >

```
/* List items that are children of the "my-things" list */  
ul.my-things ~ li {  
  color: red;  
}
```

Descendant combinator

- Ancestor and descendant

- Syntax: `div ~ li` (a single space)

```
/* List items that are descendants of any <div> */  
div ~ li {  
    color: red;  
}
```

Pseudo-elements ::

- Pseudo-element selectors select a certain part of an element rather than the element itself.
- Examples:

```
/* Selects the first lines of any <p> */  
p::first-line {color: red;}  
  
/* Selects the first letters of any <p> */  
p::first-letter {font-size: 2em;}
```

- See more [examples](#)

Pseudo-classes :

- Pseudo-classes style certain states of an element.
- Examples:

```
/* Selects any <p> that is the last element among its siblings */
p:last-child {
    color: lime;
}
/* Selects the second <li> element in any list */
li:nth-child(2) {
    color: lime;
}
```

- See more [examples](#)

Link styles

- `a:link` (applies to normal links)
- `a:visited` (applies to visited links)
- `a:hover` (affects a link when cursor is placed above it)
- `a:active` (applies to active links)

In-class exercises

- Try and play with these advanced selectors in any of your old files.
- Play with [CSS Diner](#)
